ROOTCANAL TREATMENT

Answering a few questions on your mind...

Page 2: What is a root canal treatment.

Page 3: FAQ about root canal tyreatment.

Page 4: Single sitting rootcanal treatment.

Page 5-6: Can root canal treatment fail.

Page 7: Case of the month.

Page 8: They say it, We love it.

ROOT CANAL TREATMENT is a dental procedure to remove inflamed or infected pulp on the inside of the tooth which is then carefully cleaned and disinfected, then filled and sealed. Root canal treatment is designed to eliminate bacteria from the infected root canal, prevent reinfection of the tooth and save the natural tooth.

The complete DENTAL Care Center

IS A ROOT CANAL TREATMENT **PAINFUL ??**

NO, it is painless, with modern technology and expert care it is not painful anymore.

HOW MUCH **TIME** DOES IT TAKE ??

A root canal treatment typically takes around 2 sittings to finish.

zero cavity
The complete **DENTAL** Care Center

CAN YOU DO A ROOT CANAL TREATMENT IN A **SINGLE SITTING ??**

Works best in **selected cases**

Not every tooth is suitable for a single sitting. If there is severe infection, swelling, or pus discharge, we may need to treat it in multiple sittings for safety

So single-sitting root canals are safe, effective, and convenient when chosen for the right cases. Always **trust your dentist** to guide you on what's best for your tooth.

CAN A ROOT CANAL TREATMENT FAIL ??

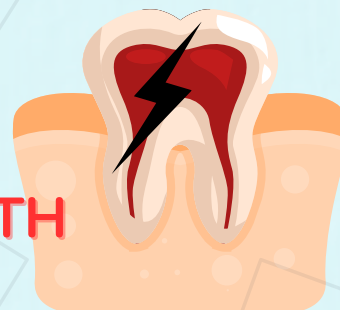

YES BUT RARELY, root canal treatment can fail sometimes due to one of the following reasons.

1. INFECTION LEFT BEHIND

Possible, if there are remanant bacteria even after root canal treatment, in some case a tooth may have narrow canals that can be missed cleaning.

2. CRACKS IN TOOTH

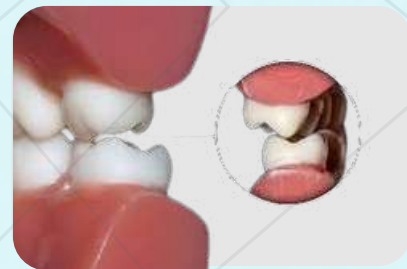

If the tooth has a hidden crack, it becomes very difficult to seal it completely, and this can lead to failure

3. DELAY IN CROWN OR AN ILL FITTING CROWN

After a root canal, the tooth becomes weak. If you delay putting a crown (cap), germs can re-enter and damage the tooth again. If the filling or crown does not fit tightly, bacteria can sneak inside the tooth and cause reinfection

4. TOO MUCH BITE PRESSURE (OCCLUSAL OVERLOAD)

If one tooth takes all the chewing force (because another tooth is missing), the root canal tooth can get overloaded and fail.

How to Prevent Root Canal Failure?

- Get your crown placed immediately after the root canal.
- Go for regular dental check-ups to detect problems early.
- Make sure your bite is balanced – missing teeth should be replaced.
- Visit a dentist if you feel pain, swelling, or discomfort near the treated tooth.

CASE OF THE MONTH

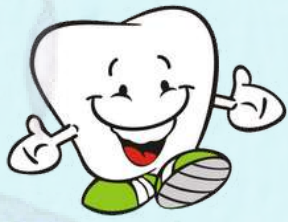

Severe infection in upper front tooth..

*Root canal treatment
advised and completed
in multiple sittings.*

*Tooth restored
with a crown*

*They say it..
We love it..*

I was always scared about the process of dental treatment but Dr. Dhruti and Dr. Snehal and the entire team at Zero Cavity Dental Clinic have been really friendly and make their patient understand the whole procedure very well and made the process extremely smooth for me. Dr Dhruti and Dr. Snehal both are extremely good dental surgeons.

The staff is also well trained and hygienic.

My experience with Zero Cavity was comfortable and painless.

Thank you once again for making me feel great.

Mrs.Bhavana Iyyer

QUOTE OF THE DAY

The greatest gift you can give someone is the gift of your time
